### **Abstract**

Antibiotics are frequently used in dentistry, both prophylactically and therapeutically. Antibiotic overuse in children, particularly for dental and ear infections, is highly common. Antibiotics are frequently used to treat oral infections and prevent systemic bacteremia. Resistant

bacterial strains arose as a result of a lack of understanding of antibiotic indications. For paediatric patients, prescribing the correct dosage of medicine is critical. The focus of this review paper is on the proper use and misuse of antibiotics in pediatric dentistry.
