Abstract:

For an efficient and effective treatment of skeletal Class II malocclusion is by interceptive approach during the pubertal growth stage. When considering early Class II therapy psychosocial issues and a greater risk of dental trauma are certain factors that should be addressed. This case report is on a patient who underwent orthodontic treatment due to aesthetic discomfort with the incisors protrusion. As the patient was in the circumpubertal stage, it was decided to try a different approach of treatment. This case report is on Herbst appliance and fixed multibrackets therapy during the circumpubertal stage, resulting in an adequate outcome.
