Key words: COVID -19, immunization, vaccination in India

ABSTRACT

Introduction: The study was done to assess whether a significant proportion of population got immunized in a fair amount of time compared to that of vaccination strategies of Singapore, and the results will be useful in the event of a future pandemic breakout. **Objectives:** To evaluate time taken for implementation of covid 19 vaccination in India and to compare current vaccination approach in India with that of Singapore's. **Methodology:** The information was taken from Co-win app that tracks real time COVID-19 vaccination administration in India and was evaluated in total and also on the basis of age, sex and state basis over a period of one year. The website of Ministry of Health, Singapore, was used to collect data regarding the number of individuals immunised in Singapore. **Result:** 57.2% and 86.2% of the population has been fully vaccinated in India and Singapore respectively. **Conclusion:** Even though population of

India is very large, more than half of them are fully vaccinated which is comparable to the percentage of immunisation achieved in a very less populated country like Singapore within a year.
